AMENDMENT

In the Claims

Please amend the claims as follows:

- A method for producing disaggregated biologically active protein from a mixture 1. comprising aggregated protein comprising the steps of:
 - adjusting total protein concentration in the aggregate mixture to from about 0.01 (a) mg/mL to about 500 mg/mL; then
 - increasing the pressure on the aggregate mixture to from about 0.25 kbar to about (b) 12 kbar for a time and temperature sufficient for disaggregation of the protein; then
 - (c) incubating the mixture under pressure in the range from about 0.25 kbar to about 3.3 kbar for a time from about 0.10 to about 12 hours; then
 - (d) reducing the pressure to atmospheric pressure, whereby protein in the mixture remains disaggregated and biological activity is retained.
